- 1. How far away is the nearest star beyond the Sun, in parsecs?
  - ○a. between 1 and 2 pc
  - Ob. about 4 pc
  - $\bigcirc$  **c.** between 1/2 and 1 pc
  - **d.** about 12 pc
- 2. Suppose that two identical stars (they have the same total light output) are located so that star A is at a distance of 5 pc, and star B is at a distance of 25 pc from Earth. How will star B appear, compared with star A?
  - $\bigcirc$ **a.** Star B will be 1/20 as bright as star A.
  - $\bigcirc$  **b.** Star B will be 1/25 as bright as star A.
  - $\bigcirc$  **c.** Star B will be 1/2 as bright as star A.
  - $\bigcirc$  **d.** Star B will be 1/5 as bright as star A.
- **3.** The Pleiades cluster consists of a number of bright stars wrapped in a cloud of gas and dust that appears blue. This cluster is an example of
  - **a.** a reflection nebula.
  - **○b.** a dark nebula.
  - $\bigcirc$ **c.** a giant molecular cloud.
  - **Od.** a stellar "nursery."
- 4. New stars are formed from
  - $\bigcirc a$ . hot supernova remnants.
  - $\bigcirc$  **b.** activity around black holes in the centers of galaxies.
  - ○c. pure energy in free space.
  - **O**d. huge, cool dust and gas clouds.
- **5.** The stars that last longest are the stars
  - $\bigcirc$ **a.** with the largest mass, that is, the largest amount of fuel.
  - **b.** with the largest luminosity and highest temperature since they take the longest to cool down to invisibility.
  - $\bigcirc$  **c.** with the smallest mass.
  - **d.** of intermediate mass; small-mass stars have little fuel and burn out quickly, while very massive stars burn their fuel very rapidly.

- 6. What makes a red giant star so large?
  - $\bigcirc$ **a.** The star has many times more mass than the Sun.
  - **(b.** Red giants are rapid rotators, and centrifugal force pushes the surface of the star outward.
  - $\bigcirc$  c. The helium-rich core has expanded, pushing the outer layers of the star outward.
  - $\bigcirc$  **d.** The hydrogen-burning shell is heating the envelope and making it expand.
- 7. What is the most important use of Cepheid variables for astronomers?
  - **a.** The distance to a Cepheid variable can be found very easily.
  - **(b.** The diameter of a Cepheid variable can be found very easily.
  - The characteristics of the pulsation of a Cepheid variable can be used to investigate conditions in the core of the star.
  - **d.** The metal content of a Cepheid variable can be found very easily.
- 8. The age of a cluster of stars can be judged by the
  - $\bigcirc \mathbf{a}$ . amount of radioactive elements detected on the surfaces of its stars.
  - **b.** number of novae per year occurring within the cluster.
  - ○c. turnoff point on the main sequence of its Hertzsprung-Russell diagram.
  - **O**d. total number of stars within the cluster.
