- **1.** A star of apparent magnitude +5 appears _____ than a star of apparent magnitude +3.
 - **Oa.** farther away
 - **Ob.** fainter
 - Oc. brighter
 - \bigcirc **d.** either brighter or fainter, depending on the distance to the stars
- 2. What is a star's luminosity?
 - \bigcirc **a.** total energy emitted by the star into all space per second, measured in watts
 - **b.** apparent magnitude the star would have if it were located exactly 10 ly from Earth
 - \bigcirc c. apparent magnitude the star would have if it were located exactly 10 pc from Earth
 - \bigcirc **d.** amount of energy received per second on 1 m² of a planet's surface exactly 1 AU from the star
- 3. The Hertzsprung-Russell diagram is a plot of
 - \bigcirc **a.** absolute magnitude (or intrinsic brightness) against temperature of a group of stars.
 - **Ob.** apparent brightness against distance for stars near the Sun.
 - \bigcirc **c.** luminosity against mass of a group of stars.
 - **Od.** apparent brightness against intrinsic brightness of a group of stars.
- 4. As you move upward and to the right on the H-R diagram, stars become
 - **a.** cooler and dimmer.
 - **b.** hotter and brighter.
 - Oc. hotter and dimmer.
 - **Od.** cooler and brighter.

5. What is a white dwarf star?

- \bigcirc **a.** a star of about the same size (diameter) as Earth
- \bigcirc **b.** a star that is significantly smaller than a giant or supergiant star
- \bigcirc c. main-sequence star with a surface temperature near 12,000 K
- Od. large, planetary object, such as Jupiter

- **6.** A red supergiant star is found to have a surface temperature of 2500 K and a luminosity 100,000 times that of the Sun. Use the Hertzsprung-Russell diagram in Figure 11-8 of *Discovering the Universe*, 10th ed., to determine its approximate radius compared with that of the Sun.
 - ○a. about 1000 times larger
 - **Ob.** almost the same
 - ○c. about 100 times larger
 - **O**d. about 10 times larger
- 7. How do astronomers measure the masses of stars?
 - \bigcirc **a.** by measuring the star's brightness, temperature, and distance
 - \bigcirc **b.** by observing the motion of two stars in a binary star system
 - \bigcirc **c.** by observing the star's brightness at different wavelengths (colors)
 - Od. by measuring the star's brightness and obtaining its radius using the H-R diagram
- 8. Stellar parallax appears because
 - \bigcirc **a.** stars move in space.
 - \bigcirc **b.** stars have finite size (i.e., they are not really just points of light).
 - **Oc.** Earth moves in space.
 - **Od.** Earth rotates about its own axis.
