- 1. What was the material from which the solar system formed?
 - **a.** nebula made mostly of heavy elements but enriched in hydrogen and helium from supernova explosions
 - \bigcirc **b.** nebula made entirely of hydrogen and helium gas
 - $\bigcirc \mathbf{c}$. debris from the explosion of a massive star
 - $\mathbf{S}_{\mathbf{d}}$ nebula made mostly of hydrogen and helium gas but enriched in heavier elements from supernova explosions
- 2. The large amount of free oxygen in Earth's present atmosphere is primarily a result of
 - **Oa.** carbon dioxide becoming dissolved in the oceans, releasing oxygen.
 - **Solution Solution Solution**
 - \bigcirc c. out-gassing by volcanoes and other geological processes.
 - **O**d. splitting of carbon dioxide into carbon and oxygen by solar ultraviolet light.
- 3. Ozone in the stratosphere performs an important task that protects life on Earth. What is it?
 - \odot **a.** Ozone absorbs much of the dangerous solar ultraviolet light.
 - Ob. Ozone absorbs the solar wind as it streams into Earth, thereby protecting life from dangerous ionizing radiation.
 - Oc. Ozone acts as a disinfectant, killing dangerous viruses and bacteria that drift in all the time from space before they can reach Earth.
 - **O**_d. Ozone absorbs infrared radiation, thereby providing a comfortable atmospheric temperature on the surface of Earth.
- 4. On Earth, the majority of earthquakes occur
 - \bigcirc **a.** along the zone of maximum tidal stress around the equator.
 - **Ob.** along regions of greatest thermal stress in arctic and antarctic regions.
 - $\mathbf{Sc.}$ along the boundaries of major tectonic plates.
 - **Od.** in the centers of tectonic plates (e.g., North American continent).
- 5. Earth's magnetic field protects Earth and its inhabitants from
 - **a.** a significant proportion of the solar neutrinos, the enormous flux of which could otherwise produce damage to genetic material in life forms.
 - **Solution** Solar wind, which would otherwise irradiate and damage life forms if not deflected.
 - $\bigcirc c$. the high-energy cosmic rays or hydrogen nuclei moving through our universe.
 - $O_{\mathbf{d}}$. the majority of tiny but high-speed micrometeorites, which otherwise would crater Earth and cause significant damage to property.

- 6. What is the origin of the majority of lunar craters?
 - **Oa.** volcanic explosions
 - **Ob.** surface collapse after loss of groundwater by evaporation
 - Sc. impacts by meteoric material
 - **Od.** impacts by space probes from Earth
- 7. The smooth, dark maria on the Moon are
 - \circ a. areas that were still molten at the time of the early, heavy bombardment and therefore show no evidence of the impacts.
 - $\mathbf{S}_{\mathbf{b}}$. immense impact basins that are smooth because they were covered by lava flows after the early, heavy bombardment had ended.
 - **O**c. immense impact basins that are smooth because earlier craters were wiped out by the impact.
 - **O**d. regions that, although as old as the cratered highlands, escaped the early, heavy bombardment.
- 8. When do neap tides occur?
 - \bigcirc **a.** only when the Moon and the Sun line up on the same side of Earth
 - **b.** whenever Earth, the Moon, and the Sun form a straight line, regardless of which side of Earth the Moon is on
 - Sc. whenever the Earth-Moon line makes a 90° angle to the Earth-Sun line Stream and the Earth-Sun line Stream and Stream
 - $\circ_{\mathbf{d.}}$ only when the Moon, Earth, and the Sun form a straight line, with the Moon on the opposite side of Earth from the Sun
